

Re:RM-11708

I support the proposed change to the rule and would add an additional permission. That would be to allow the use of both digital and voice on any net with a net control station. With the advances in the various modes passing traffic via voice on a net is a deterrent to accuracy and speed when the use of mixed modes on a net would result in more efficient use of the frequency as well as insuring greater speed and accuracy, particularly when conditions are marginal.
