The FCC document "Digital Cable Compatibility: CableCARD-Ready Devices" at <http://www.fcc.gov/guides/digital-cable-compatibility-cablecard-ready-devices> states the following at point 2 under "Benefits of Retail CableCARD Devices" "You will be able to take your CableCARD-ready device anywhere in the country and know it will work on cable system offering digital services - all that is needed is a cable operator-provided CableCARD." I have contacted Comcast about this issue and they have stated that a user purchased set-top box is only available to use in a single location. This policy appears to be in direct conflict with the above stated FCC policy. Comcast states that their system will not allow the same piece of equipment in more than one location on their cable network. This seems to be an internal issue that Comcast could easily remedy by uniquely identifying the equipment by using the equipment serial number added to the CableCARD identifying ID. As an alternative, it could remove the equipment from the former account and add it to the new account each time the equipment is moved. Comcast needs to modify their system to allow users to move customer owned equipment and adhere to the guideline stated above.
