There is no need for PACTOR III or PACTOR IV on HF for EMMCOMM. In every major emergency - including Superstorm Sandy - the long haul traffic for which HF is suited was handled by internet. The heavy volume traffic for which PACTOR III/IV would be used was confined to VHF where the higher signalling rates are currently legal. One need only read the after action reports of emergency after emergency - including the one from New Jersey ARES after Sandy to see this pattern. Safety of Life and other short messages are more than adequately handled by PACTOR I or PACTOR II in a 500 Hz bandwidth at HF.
