

7521070600.txt

Greetings and Thank You for taking my comments.

I write today to voice my opinion that the FCC should classify broadband and wireless carriers of Internet Traffic as it does for the telephone and backbone telecommunication carriers, as common carriers of internet traffic. I strongly oppose any restriction on port access to consumer or business computer systems or any attempts to limit telecommunication traffic on the internet, on the bias of content discrimination, whether sending or receiving information or content. A 100% open and free internet, pertaining to content an entity wishes to send or receive is the right choice for the Internet in the United States of America.

Common Carriers already conduct business by providing bandwidth (speed and volume restriction) as a pricing model and this is acceptable. However, content licensing should not occur, especially for residential and commercial applications.

Legal, lawful and non-copyright infringing content has no place in the pricing schemes of internet service providers.

Thank you for letting me voice my opinions.

My best regards,

Robert Smith
