

7521094493.txt

Wireless Internet Service Providers have been not only providing rural services where wire-line providers have failed to penetrate, new technologies at lower costs are allowing them to move into higher density areas. These providers often can drive consumer prices lower, provide better and faster services, and break the digital divide and monopolies that are driving up costs. Mimoso's proposal to add frequencies will allow WISP operators to provide cable and fiber speeds at 5% of the cost. Please reference the following articles that I have written:
