It seems that the current FCC Commissioner is beholden to the cable companies that he once lobbied for. Right now there are a few choices because only one or two ISPs serve a given community. Giving them the ability to shape how traffic is delivered to its users should not be allowed. For example if you typed PizzaHut.com, the company could very easily create a page that says while we are loading PizzaHut.com would you like to visit x-pizza company instead. How do something like this keep the open Internet laws that are already in effect and should be kept in effect.

Reclassify Internet Service Providers As Common Carriers.

The easiest way to prevent this from ever happening again is to classify Internet service providers as common carriers. Contrary to what cable and ISP companies will say they are considered a utility now. Most if not all sites have a phone number buried far deep in its pages and want you to contact them via their website. If they are not reclassified as common carriers is a great disservice to folks who rely on the Internet for work.
