To whom it may concern

Tim Wu (the creator of the term net neutrality) is quoted in the New Yorker as saying "With broadband, there is no such thing as accelerating some traffic without degrading other traffic." If ISPs are allowed to throttle traffic, this will damage growth in our economy.

This frustrates me to know that the folks who would be hit hardest by this are small and middle-size businesses and startups. Small businesses are able to compete with larger businesses due to their creativity and innovation. If ISPs are allowed to provide better performance to larger, more established companies, small companies will be put at an even more significant disadvantage.

Please don't stifle our economic growth when we need it the most. Classify ISPs as common carriers.
