Wide bandwidth digital is too broadband for the Amateur HF service. There just isn't enough room for those kinds of emissions. Too disruptive.

Experimenters have plenty of room in VHF for those kind of activities.

Additionally, some whose opinion I respect suggests that some of these new emissions will be so close to encrypted, amateurs will have difficulty communicating with each other when both want to use the same frequency but not with each other. That is intolerable. We need to be able to communicate with each other about such things.
