

Hello,

I am reaching out in regards to proceeding number 14-28 as I believe this is a terrible idea. I do not believe that allowing ISPs that connect our nations users to the internet backbones which connect them to data centers should be allowed to charge a premium for an internet fast lane. The ISPs situation in America is currently in a terrible state. We the "consumer" do not have choices as ISPs carve out areas and choose not to compete. The lack of choice coupled with #14-28 would continue to put a strain on 'internet' and cause business loss, stifling innovation. I code, I terminate cables and I work in a data center as a Network administrator. This proceeding would only cause the internet fragmentation and consumer confusions when issues arise. Ultimately this would result in more investigation and understanding of complex network design decisions that are meant to reap the most amount of profits while providing the least amount of support and service.
