To the FCC, in regards to the proposed "fast lane" law,

This proposed change, if it went through, would be devastating to the idea of net neutrality. It would end with preferential treatment, and does have a serious potential to leave a precedent for a slippery slope of ISP control over what data is sent. Bits are bits, and how much is sent is going to continue to increase, and the argument of some sites increasing traffic is made void. They promise a certain level of service, and regardless of what's sent should be obligated to withhold that promise.

Net neutrality is a must if we are to maintain a free and open internet.
