Preserving Net Neutrality is perhaps one of the most important issues of the 21st century. The internet as a whole has spurred so much growth, and has allowed anyone with a good idea to reach others with that idea. The internet is a mass of data and ideas, and ISPs have only one job: to provide access to that mass. Allowing them to discriminate between parcels of data is an abominable intrusion into this system. Allowing ISPs to control access to the internet opens the door for a whole host of terrible consequences where ISPs limit internet users' access to competitors, destroying basic market principles. Net Neutrality must be in place to prevent the internet from turning into a corporate playground.
