As a network engineer I know how data is moved from place to place. Now that almost all ISP's whether telecommunications or not now provide the same services. If that is true then they should be held accountable to the same standards as the standard telephone laws. Having the ability to treat data differently due to those that the ISP's deem more profitable, limits the ability for U.S. Citizens to voice themselves on the same playing field as parties with large expenses. Start up companies would also struggle to have the same bandwidth to build on, as the mega corporations that can afford it. It also has the ability to limit news and information to the average person based on the views of the ISP owners.

The internet is not much different than the U.S. Highway system. If it were treated the same, only certain companies would have access to the high speed lanes, and people would be restricted as to where they could drive, and where they could visit.

As a government entity most of the U.S. population expect you to protect the citizens from corporate over reach and keep monopolizing businesses from preventing new ideas and companies from growing.

Sincerely Yours
Navy Vet
