Once upon a time the internet was slow, far too slow for instantly loading videos and pictures everywhere. What did we do? We invented more efficient ways of loading and displaying video. We designed websites intelligently to load quickly despite slow connection speeds. We paid money for faster ISPs, rewarding infrastructure improvement.

Now various ISPs would like to "solve" the problem of steadily increasing internet traffic by artificially slowing internet traffic they don't like. This power would inevitably be abused. This power would be nearly impossible to track or regulate. This power would ruin the internet.

Please preserve an open internet, one in which all data is treated equally. It will motivate infrastructure growth and intelligent web design and technology. Please classify broadband internet as a telecommunications service.
