although I regularly believe in Brevity, now is frankly not the time. It has come to my attention as a US citizen and internet user that the FCC has a chance to approve broadband internet as a Title II common carrier telecommunication service. I believe that this is not only a good idea, it is very important that we do so. I am not doing this because someone told me to, I'm not doing this without a fairly firm grasp on the subject. I'm here to say, make broadband Internet a title II common carrier telecommunications service.

The main reason that you should do this is simple, I don't want a company to restrict my flow of information. Without this movement, the Internet Service Providers that govern the means by which I receive internet would be free to regulate how they deliver the service of internet to me. The issue I have with this is that the use of my internet is not only highly personal, it is not the business of the Internet Service Provider to change how I use it. They have no right in the same way the Post Office has no right to change what I send using their boxes or what words I use by sending letters.

What's more, our country is predicated on the freedom of speech, and for someone such as myself to freely speak my mind in the 21st century, I use the internet. That freedom to say what I like where I like should not be able to be muddled by large companies run by people I have never met who just might not like it if I send letters and memos to Regulatory powers within the federal government. Regulatory powers just like this one.

This is a no brainer, this is a question of rights and freedoms, standing for those rights and freedoms, and at a base level common sense. Make Internet Service Providers a Title II common carrier telecommunications service.
