If the FCC fails to designate ISPs as common carriers, then it shows that the FCC has forsaken its purpose to protect the liberties of its constituents and that it bows to corporate interests more-so than it does to those it was created to protect.

As Mozilla said, "Categorizing remote delivery services as telecommunications services is consistent with the guidelines set by both Congress and the DC Circuit Court of Appeals, and would give the FCC ample ability to adopt and enforce meaningful net neutrality. With clear authority and effective rules, ISPs would be prevented from blocking or discriminating against any edge provider, whether on a wireline or wireless network."

By not classifying ISPs as common carriers, the possibility of ISPs abusing their consumers is a real threat. In today's day and age, the age of information, failure to reign-in ISPs will result in stifled freedoms and ideas, of which all humans can benefit from. Categorizing ISPs as common carriers preserves the soul of the internet, American Constitutional Ideals, and the interests of humans as a whole.
