

In response to the internet neutrality debate; major corporate internet providers (Comcast, Time Warner Cable, AT&T, etc.) should not be able to regulate the individual bit rates of specific websites, video players, pictures, or any other data as a result of all of this being classified as data that is open to the public. Also, the fact that Comcast is trying to merge with many other smaller internet providers worries many and is coming very close to violating the Sherman Anti-Trust Act of 1914 which was created so that competition can exist and fuel the American economy based on the fact that monopolies, and large trusts can and will "control" senators and congressman by sending suggestive threats or by just simply bribing the government officials to "look the other way" while these monopolistic providers go about their way by charging more for faster internet speeds for a certain website, application, game, etc. over other said data packages.
