We have benefited enormously from the egalitarian way in which the Internet treats information regardless of type or source, some of the most successful companies in America owe their existence this feature, but the FCC has failed to establish it as policy. Now the FCC has proposed a system that allows broadband providers to discriminate amongst Internet traffic, ensuring special treatment for companies and services of their choosing, the opposite of the neutral Internet that has existed so far. When the court vacated the FCC's weak rules on traffic discrimination in January, the judge gave a specific instruction on how they could ensure a neutral Internet within the boundaries of the law: reclassify Internet broadband providers as "common carriers." We are petitioning for just that.
