In 2004, the FCC basically said, Hey, ISPs, we made some network neutrality rules for you, yay for open internet! And then Comcast started throttling bittorrent, which was against those rules. There was a court case that Comcast won, with the argument that the FCC couldnt legally enforce those rules because they werent official enough. So the FCC created the Open Internet Order of 2010 and voted on it and passed it and finally, net neutrality had real official rules! And Verizon took the FCC to court and was like, Are you sure these rules are for us? Because, they look a lot like the rules for common carriers, and we are not common carriers, so we are thinking the rules do not apply to us. And Verizon won. So if the FCC can not enforce their own rules because ISPs are not classified as common carriers, a lot of people think the FCCs next move should be to classify ISPs as common carriers.

The FCC should not undo what it work for the past decade on. Immediately reclassify ISPs as Title II Common Carriers.
