I believe in a free and open web. According to the past FCC actions, you do too. The problem lies in ISP's believing they aren't common carriers and thereby dancing around the laws you have put in place. Until you classify ISP's as common carriers, they can slow down and block whatever sites they want in a form of competition suppression. I point to Comcast and Verizon for throttling netflix, I point to Sprint for entirely BLOCKING UDP connections. This can't be legal to allow big companies to decide what content gets to the paying customer. But it is legal.... Until you the FCC decides to actually enforce the laws you've already made.
