The FCC should reclassify broadband internet as a telecommunications (or "Common carrier") service. Right now broadband is regulated like TV or radio, which doesn't make sense.

The worldwide web is not just some entertainment medium; it's the aether of information for modern technology. News, weather, entertainment, communication, buying, selling, monitoring, sharing, teaching, learning, expressing, and exploring are just a few of the things done with internet access millions of times per day. It's interactive and relies on interaction to work, and it works by communicating information across systems. By definition, it is a telecommunications service.

By ending "net neutrality" you will doom the already dwindling American economy. You will end competition in the industry, creating an enormous hike in price for what is and always has been an open environment to escape to. You can't put a price on the freedom of the internet.

In Europe, net neutrality is already law. We can't lead the charge in this one, but better late than never.
