The only way to guarantee an open Internet is to force ISPs to treat all traffic completely equally. Prioritizing some data to a fast lane is not possible without other data being slowed. Force all ISPs to become common carriers. Even better, the government should take the physical infrastructure away from the ISPs and make it a public utility. Then anyone can start an ISP and competition will correct all the issues. This is how it works in the UK and many other countries where Internet is very fast and very inexpensive. If the US is to consider itself the best, shouldn't it have the fastest and cheapest Internet of all?
