ISPs need to be classified as a Class 2 Common Carrier. ISPs should not get all the benefits of being a Common Carrier but not be restricted as all the other Common Carriers. Do not allow this precedent to be set. If the ISPs are worried about volume then there should be an update to the infrastructure. In the long run, that will be needed, there will only be an increase in the volume of data being transmitted and allowing ISPs to make so called fast lanes which slows everything else down is not a sustainable option to internet traffic.
