I do not think the current FCC proposal will protect citizen interests. Allowing companies to pay for faster service will in turn cause those services to cost more for the private citizen. Services the citizen is already paying for by paying for access to the internet through their IP and for the services directly (e.g. Netflix).

The customer is already paying twice to get to the content they want. Any increase in the a service provider's costs will be pushed along to the consumer. The consumer, who cannot spend the money to lobby for their interests, is the one who will end up feeling the results of this proposal.

Please reconsider treating IPs are common carriers under Title II.

Thank you.
