It's time to treat the Internet as a public utility. All traffic should be treated the same, with no intentional slowing of some information. Creating an artificial "slow-lane" and then charging people to get out of it is unethical. It would be tantamount to a private company setting up a system to charge people to exceed 30 MPH on the Interstate. Any system which creates a tiered Internet will destroy the Internet.

Instead of trying to help boost the bottom line of ISPs, why not focus on ways to increase competition for "the last mile?" That would foster business growth, and help the end-user, who are the reason the Internet (in its current form) exists at all.
