

I'm very concerned that early this year the supreme court has allowed my Internet Service Provider to have "legal" access to slow down and degrade websites that I go to whenever I want to entertain myself and my friends and family, to check my emails and messages, or if I want to look and find a job and apply to it, or for other various purposes and I feel that these are extremely vital to me and I don't want these services slowed down or blocked by my ISP, the government, or anybody for that matter.

Even more concerning is that I've seen videos on YouTube that would appear to me, and many other people, showing you demonstrating a lack of interest in hearing individuals, such as myself, voicing their opinions and concerns about how the internet will be handled with net neutrality completely out of the way, and you seem to be in favor of the ISP companies that wants to have an unbalanced and unfair advantage of the internet that they provide to me and other people that pay for it.

The word "provide" means to supply or give (either for free or for a price) and nothing more, therefore, getting rid of net neutrality and permitting my Internet provider to alter my internet experience will make the word "provider" meaningless as they would now tell me what sites I can go to and what sites I can't go to by slowing down or blocking those sites entirely.

My internet provider, as well as other ones, were never involved in creating the internet when it first started many years ago up to today, so I don't see how my provider has any right to alter my internet experience, the job of the internet service provider is to "provide" internet to their customers and nothing more, it doesn't mean that they can slow down or block sites or control it, it means that they can and should supply the internet for their paying customers.

I, as well as many other people, would like it very much if you would bring back net neutrality laws that requires ISP's to treat all data and information on the internet equally and not to discriminate and make sure that they follow it.

Getting rid of net neutrality will also make it difficult for new sites just starting to become big and popular like YouTube or amazon and stifle creativity for the internet. By creating a fast lane and slow lane, new sites with interesting content most likely not afford to be on the fast lane and will just remain on the slow lane where if someone were to go to that site and find out that the site is loading very slow most likely will not have the patience of being on that site, this will hurt new businesses on the internet if they can't afford to be on the fast lane like amazon or YouTube or reddit.

I have said my complaints about this rather complicated issue, and if its possible, I would like to here a response back from you saying what you think, thank you.
