Please reject paid speed tiers on the internet. Internet backbone providers have a virtual monopoly on delivery and cannot be trusted as gatekeepers for content providers. Of course they will prioritize their own content's traffic if they are allowed to do so. We need free markets, not sweetheart deals for insiders. As a network technician, I know that a multi-speed internet will result in more bottlenecks and transmission problems as differing service speeds result in timing errors. This proposal will further consolidate telecommunications, cable and content providers, reducing competition and raising prices for the consumer. We already pay for higher speeds on the consumer side, but under this proposal, providers will pass on their increased transmission costs to the consumer, raising already sky-high prices. Non-profits and small businesses that cannot afford high-speed service will suffer from slow transmission speeds, creating an internet backwater, and stifling innovation. This does nothing to guarantee higher base internet speeds, while we watch other countries race past us with 50Mbps internet rollouts to everyone! Please reconsider this false net neutrality in favor of true, equitable and free markets. No roadblocks, setbacks, or throttling, for legitimate content, can be allowed on a free internet.
