Anything that will increase the control cable providers like Comcast and TWC have over the internet is the wrong direction for us as a country. Companies like Google Fiber have shown that we have the technology to jump to entirely new levels of speed and access to the resources the internet can provide. We don't need to be mucking around in how to adequately allocate the limited resources these cable providers have been trying to pass off as our only option year after year. They need to learn to reinvest their high profits in their infrastructure and customer service rather than spending it on lobbying the government to aid in creating a blanket monopoly of non-competing ISPs across the nation providing customers with no choice than to go along with their schemes. It's their internet or no internet.

Ending net neutrality regulations can only work in an environment where true competition exists and that environment is non-existent the way ISPs have carved out territory across the country. The Comcast CEO openly admits they don't compete with TWC and uses this as an argument for why they should be allowed to merge. The ISP industry is expensive to enter, so few companies exist in the space. Allowing those companies to not compete and not innovate is bad enough, but ending net neutrality will also make it difficult for other companies to compete without the capital to payoff the ISPs for access to the once open internet. Keep the internet open!
