The internet has been an incredible force in democratization and a broadening of access to information in the modern era. It is an amazing tool, a tool which is now under threat. If net neutrality is undermined through FCC action, allowing a so called fast lane for Internet services this open playing field will become increasingly stratified. Startup companies unable to pay the necessary fast lane fees will be at an inherent disadvantage in such a world. Today, it is posed by cable companies that we would have a fast lane and a super speed lane, which MAY be true. However, what incentive would cable companies have to upgrade their lower level internet speed if it meant companies would have less reason to pay for the fast lane? I think it far more likely the gap between two internets grows and grows, in order to protect the investments of the cable companies. I speak as a user who streams plenty of TV, and I do not find current loading times to be so infuriating I need a so called fast lane. I worry far more about the consequences of such stratification. I won't delve into the already existing monopoly concerns, but it is easy to imagine an internet which becomes dominated by the large companies able to protect their investment through monetary insurance via a fast lane internet. I hope the FCC chooses to side with the people, and defends an open democratic internet for all.
