Please reject RM-11708. 2.8Khz wide data should have no place in the CW/Data sub-bands of the Amateur Radio Service. Devices that are that wide should be in the phone portion of the Amateur radio bands. Furthermore, many of the current wide data modes are being used by automated devices that do not adequately check for existing operation before they transmit. This causes unnecessary interference.

The FCC should reject RM-11708.
Thank you.
