I am against RM-11708. I am in favor of a compromise solution which will allow better support of the new/proposed wide-bandwidth modes, but not without also ensuring that the current narrow-band modes continue to have dedicated band segments where interference from the proposed wide-band modes will not be allowed. Please review/revise the proposed changes to allow support of the new wide-band modes without excluding the needs of the existing narrow-band modes. Thank you.
