

Dear FCC Personnel,

Information transmission systems best serve commercial and civic purposes when broadly and equally accessible to all potential users with no bias towards any specific party. This is extremely evident in the governing of current information systems such as radio wavelengths, telecommunications, and even interstate highway systems. Publicly regulated civic systems, like those mentioned, have been the primary driver of technological economic expansion. Private commercial interests expand inside these layers of civic infrastructure.

Allowing communications companies to consolidate power and allocate information flow with only short sighted commercial interest is ultimately detrimental to the commercial and civic well being of the economy. Alienating and handicapping competition and innovation breeds stagnation, apathy, and eventual collapse of a free market system. The current system of net neutrality is the preferable situation for people and their interests to flourish in.
