Net neutrality is at the core of what the internet is. Why would we give the power for internet service providers (ISP) to throttle the speed I get my data. That is limiting freedom of speech and access to information. I understand it is a free market which could give competition to who gives unlimited access to the internet vs those who block content BUT there is very little competition as it is. Also if there is very little competition why would a company out of the kindness of their heart offer full internet access when they could charge for it?

Think of it this way. An ISP can choose to information of their choice maybe religion, competing companies to put in their slow lane and no where does it say how slow can be. They could say ok you get 1 byte per minute essentially completely blocking access to that content (unless you want to wait days to get it).

This youtube video sums it up very nicely. "Keep net neutrality!!!" And based on my argument that the ISP can control content, should net neutrality be lost, ISPs could choose to block this link which negatively speaks out against them. It is a slippery slope to give ISP the choice of what you can and cannot access.
