Endangering Internet neutrality is not a choice for the US.
Creating a market over the current available bandwidth will discourage innovation for 2 major reasons.

First this approach will add cost to innovation, making it hard and may be impossible for innovators to take their projects to live.

Second the inherent issue of the bandwidth becoming obsolete, overcrowded and outdated is not being solved.

Investment is needed to improve internet infrastructure. The new infrastructure will increase bandwidth and reliability that promotes and supports new technologies, innovation, creativity without limitations.

New infrastructure will open new possibilities, improve the current state of the internet and promote progress and innovation.

Creating a market over bandwidth creates barriers and room for cheating and exploiting.
The means to control bandwidth are debatable reliable and prone to be accommodated to someone will.
