The free and unrestrained flow of internet traffic has enabled the explosion of technological expansion we have realized in the past 2 decades and enabled an overall more informed society. Phone calls made more frequently to specific people are not subjected to high rates or differential treatment, and we recognize that to be a ridiculous notion; there is phone call neutrality and this has served humanity well. The wording of the new FCC ruling provides just enough ambiguity and contradiction to bring about legal free-for-all anarchy. There was no need to even remake a rule to govern that which has survived on its own for so long. Some things in our country need more regulation and rule modifications, but the manner in which we have always freely accessed any corner of the internet should be on the bottom of that list.

It could be argued that because internet access at inception depended on dial-up access through a telephone line, it should therefore be considered an extension of this public utility and given all protections governing this classification. Protect the rights of the public and its utilities, not the Never-Enough mentality of corporate America.
