ISPs should be regulated as common carriers.

They really are a utility, like water or electricity, and price should be the same for everyone.

Big business will consume more, so they will pay more.

Look at the Billions of dollars of commerce done on the internet, and a large percentage of that is not from big business. Look at how many jobs you'd kill, the innovation on the internet would die.

And this would be deemed as damage by the internet. And you know the Internet was designed by your own defence agency to route around damage. So the world will route around the USA. And innovation in the USA will die on the internet, and it will flourish in the rest of the world and in 10 -20 years the world will be so far ahead of you, the USA will not be relevant anymore. You will lose your global dominance in the computer industry, and your economy will be irreparably damaged.

The greed and short sightness of your major ISPs is a national security threat and the FCC needs to look at these aspects too. They are a threat because while they are big business, they are not the biggest business in the USA. In fact if none of them were here tomorrow, the USA economy would barely burp. Yet this inane idea of theirs is enough to destroy the Internet's ability to create new wealth, which it has done so well for so many American startups, that are some of the largest and most profitable businesses in the USA, like Google and Facebook, Amazon and eBay.

Keep the status quo.

It is not broken so don't fix it.

These companies can find more creative ways to increase their profits.

In the mean time regulate it as a common carrier!

Now, this decision impacts more than America, so you have to consider that too. Obviously from the American perspective, still you have an obligation to the American people to do so, and not ignore it because its origins are not American.

Thank you for your considerations.

Regards,

Paul Babier
