I live in SE Florida and have been streaming Netflix via my Roku modem with AT&T as my ISP for over 4 years. Over the past few months a buffering issue has developed which has gotten progressively worse. Please note this buffering problem occurs only with Netflix content, not the streaming I do from Amazon. At AT&T's recommendation, I've converted to AT&T U-Verse (going from 3mbps to 6mbps) and, when this didn't solve the problem, again upgraded to 12mbps. No luck. There is no problem with the Roku, because everything else I stream works perfectly - it is just Netflix content that has been slowed down to the point it is unusable. I have heard that this situation is a result of AT&T "throttling" Netflix' content in an attempt to either frustrate the end user so much that they'll go back to cable, or squeeze more \$\$ out of Netflix for the use of AT&T's bandwidth. Times are changing. I'm not going back to cable. Shouldn't the FCC be protecting consumers in matters like this?
