I strongly support the inclusion of the following new codes into the EAS disaster / weather coding system:

EWV - Extreme Wind Warning

SSA - Storm Surge Watch

SSW - Storm Surge Warning

In addition I would strongly support adding a code for weather related - unspecified and non weather related - unspecified as such additions would cover ALL non coded emergencies that might arise. The user could then tune into their local NWS weather radio station and hear the details of the unspecified problem. It is impossible to produce an exhaustive list of all problems that might arise and so a couple of catch alls would be good.
