My comment is simply to support the obvious and overwhelming majority which stands in firm opposition to the unbalancing of the Internet.

Let me be frank on this topic. I am particularly disgusted by the lobby efforts of the telecommunication industry to introduce unbalanced service. The FCC needs to put in place measures that restore "Net Neutrality" and forever banish the idea of Internet "fast lanes".

I am reminded of the White Houses response to a petition regarding Net Neutrality, where they affirmed their official support for a free and open Internet. "Absent net neutrality, the Internet could turn into a high-priced private toll road that would be inaccessible to the next generation of visionaries."

I am also holding the Tom Wheeler to his word as the FCC Chairman when he pledged to "use the authority granted by Congress to maintain a free and open Internet."

I support this view. American's across the nation support this view. Even service providing companies across the nation support this view. Even a variety of Internet service providers across the country support this. The only ones who support anything else appears to be a VERY specific lobby made up of the largest residential broadband companies.

Quite frankly, again, it's appalling that the FCC has spent so much time on this issue. We already have seen the effects these companies have had since January. Service speeds to major websites has slowed down. The companies that own those sites have had to pay "protection money" to get more speed. And even after paying, our service speeds are still terrible. Take Netflix as an obvious example. I personally employ an SSL VPN to an Internet proxy and see a 30-fold, yes THIRTY-fold increase in my speed to Netflix. I am a network engineer and I have never seen a situation where you needed to ADD distance (hops, as we call it) to your infrastructure to make it faster. It sickens me.

Do the right thing. Don't destroy the most liberating technology the world has ever known.
