

Greetings gentlemen and ladies of the FCC.  
I am an American culture savvy man who resides in Texas.

This message is meant to illustrate and explain why the separation of web services into two different "Lanes" will be DETRIMENTAL to the future of the entire internet.

Short version (Please keep reading if you are not in a rush!):  
The two lanes are just a form of segregation between the super rich companies who pay would any price for normal speed internet, and the rest of the "poor weaklings" who will be unfairly kept under the whims of internet providers, those who control how slow the "slow lane" will always be.

Detailed explanation follows.

Item 1: Some proponents of this two lane plan say that the lanes will be A) Normal speed and B) faster than before speed. The counter to this lie is simple. If companies are squatting on a method to create a "Fast lane" and are holding on to it until their plan becomes practice, they would literally be guilty of holding technology hostage to gain their demands!  
Those who take tech hostage should not be appeased!

In fact, the much more likely situation is that the fastest possible speed of travel in the fast lane will be equal to the current average speed, bit-rate available now.  
If this second situation is true, than internet providers like TWC will become magnates who dictate who gets what.  
Those who dictate who gets what kind of treatment are called bullies. The modern world should never have any place for bullies.

Item 2: I am certain that you know that other less developed nations look to American practices as template for their own future practices for their own regulation affairs. If American were to choose a poor plan, other nations may quickly follow us all into the same trap. Therefore, caution with regulation changes must be maintained.

Item 3: The results of the plan are predicted to be as follows: The ones who can afford the "Fast lane" of information will buy it at any high price. Netflix will have to choose to pony up wads of cash every hour for normal data speed or choose to shut their doors.  
The ones who are too poor for normal speed will be forced to stay in the slow lane. Those in the slow lane will become fearful of internet providers in a certain extent. The slow lane users will be speed handicapped but will be unable to voice their concern without angering all internet providers who hear the complaints.  
The internet providers will love calling the shots as every data switchboard will be strictly in the providers' control.

Item 4: President Obama has hired a former lobbyist leader as the head of the FCC! Whether that was a strategic move or some type of coincidence, this will most likely contribute a bias in favor of segregating the speed of travel of internet information. This relates to this case because internal pressures may cause some "unofficial disagreement", as it were, regarding the treatment of this case. Please double check for internal bias as you proceed with the matter of determining regulation practices!

Thank you for allowing me to give you this message.  
Good luck with your decision in this matter of possible segregation of information.
