I pay \$50 monthly for 1.5 Gig up and 15 Gig down for internet access. That should give me access at that bandwidth all the way to whatever web site I visit. Similarly, the web site I visit pays for internet access at a specific speed, and they should be able to deliver that speed to me. Of course, they only get to use whatever bandwidth they are paying for, so I may have to accept a slower throughput if a website does not buy enough bandwidth. My main point is that my internet bandwidth should be determined by what bandwidth I pay for to my ISP, and by the bandwidth the web sites I visit pay for to their ISPs. The "Man-in-the-Middle" should have no bearing on my internet speed.
