Internet service providers should be considered Common Carriers regardless of the specific technologies they use to deliver connectivity. Just as public infrastructure such as roads were necessary for the development of cities and public regulation of inter- and intracontinental transport links was necessary to foster trade, unfettered access to an open internet is necessary for online innovation and information dispersal. The sheer amount of complaints about poor internet speeds and terrible customer service from ISPs should be enough to warrant action to put the United States at the forefront of internet quality and commerce.
