I of course FULLY support an open, equal access, PRIVATE internet. However I am especially troubled by the complete absence of ISP competition in this country. The main driving force behind innovation, better service, and better prices is direct competition. Not having to compete these ISP's are absolutely giving the American people a raw deal. I would like the practice of giving these internet giants exclusive rights to an area to end. We get high prices and low service yet local communities aren't allowed to put down fiber optic cable due to NO COMPETITION contracts. THIS IS WRONG

I support transparent and participatory processes for making Internet policy and the establishment of five basic principles:

Expression: Don't censor the Internet.

Access: Promote universal access to fast and affordable networks.

Openness: Keep the Internet an open network where everyone is free to connect, communicate, write, read, watch, speak, listen, learn, create and innovate.

Innovation: Protect the freedom to innovate and create without permission. Don't block new technologies and don't punish innovators for their users' actions.

Privacy: Protect privacy and defend everyone's ability to control how their data and devices are used.
